                                                                                                                                                                                                                                                                                       Sequence 14, Application US/09896888A

Patent No. US20020116723A1

GENERAL INFORMATION:
APPLICANT: The University of British Columbia
TITLE OF INVENTION: Insect Expression Vectors
FILE REFERENCE: 80021-4

CURRENT APPLICATION NUMBER: US/09/896,888A

CURRENT FILING DATE: 2001-6-29

PRIOR APPLICATION NUMBER: US/09/048,911

PRIOR FILING DATE: 1998-03-26

PRIOR FILING DATE: 1998-03-27

NUMBER OF SEQ ID NOS: 50

SOFTWARE: Patentin Ver: 2.0

SOFTWARE: Patentin Ver: 2.0

SEQ ID NO 14

LENCTH: 462

TYPE: DNA

ORGANISM: Artificial Sequence
FEATURE: TUROREMETTON DESCRIPTION OF SEQ ID NO 14

Sequence 868, Application US/10953349

Publication No. US20060107345A1

GENERAL INFORMATION:
APPLICANT: ALEXANDROV, Nickolai et al.
TITLE OF INVENTION: SEQUENCE-DETERMINED DNA FRAGMENTS AND CORRESPONDING POLYPEPTIDES
TITLE OF INVENTION: ENCONDED THERBY
FILLE OF INVENTION HORDER: US/10/953,349

CURRENT APPLICATION NUMBER: US/10/953,349

CURRENT FILING DATE: 2004-09-30

NUMBER OF SEQ ID NOS: 40252

SOPTWARE: PATENTIN Version 3.3

SEQ ID NO 868

LENGTH: 1216
TYPE: DNA
ORGANISM: Arabidopsis thaliana

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The nucleic acid of the invention replicates in prokaryotic and eukaryotic cells. The nucleic acid of the invention is useful for constructing a recombinant virus, generating replication-defective particles, preventing/inhibiting the expression of one or more genes in an organism, and are useful as gene therapy vectors. The nucleic acid of the invention is also useful for producing and expressing fusion polypeptides. The present DNA sequence represents the OpiE2 promoter that was used in the exemplification of the invention.

This represents a Orgyia pseudotsugata multicapsid nucleopolyhedrosis CC virus (OpMNPV) immediate early 2 (Op ie2) promoter sequence. The CC invention provides a new shuttle vector for transforming insect cells CC that comprises: (1) prokaryotic origin of replication; (ii) insect comprises: (1) prokaryotic origin of replication; (ii) insect comprises: (1) prokaryotic origin of replication; (ii) insect cells cearly baculovirus promoter; (iii) prokaryotic promoter sequence, and (iv) CC selectable marker capable of conferring resistance to a bleomycin/CC phleomycin-type antibiotic under transcriptional control of (ii) and CC (iii), in insect and prokaryotic cells respectively. The vectors can be used to stably transform (especially insect) cells with heterologous DNA, CC useful to allow study of gene expression and direct expression of heterologous gene products e.g. commercially important proteins. They are especially useful to allow expression of the heterologous CC melanotransferrins, ion transport peptide hormones or biologically active derivatives in insect cells. They enable transformation of insect cell lines from disparate species, allowing screening of lines for optimum constitutes in insect cells. They enable transformation of insect cell used to optimise heterologous protein expression and facilitate selection of desired transformants. (Updated on 17-OCT-2003 to standardise OS

One or more of the recombination sites is capable of undergoing recombination with a compatible recombination site in the presence of one or more proteins active in lambda recombination. The nucleic acid of the invention replicates in prokaryotic and eukaryotic cells. The nucleic acid of the invention is useful for constructing a recombinant virus, generating replication-defective particles, preventing/inhibiting the expression of one or more genes in an organism, and are useful as gene therapy vectors. The nucleic acid of the invention is also useful for producing and expressing fusion polypeptides. The present DNA sequence represents a plasmid that was used in the exemplification of the invention.

One or more of the recombination sites is capable of undergoing recombination with a compatible recombination site in the presence of one or more proteins active in lambda recombination. The nucleic acid of the invention replicates in prokaryotic and eukaryotic cells. The nucleic acid of the invention is useful for constructing a recombinant virus, generating replication-defective particles, preventing/inhibiting the expression of one or more genes in an organism, and are useful as gene therapy vectors. The nucleic acid of the invention is also useful for producing and expressing fusion polypeptides. The present DNA sequence represents a recombination region of a plasmid that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                               detection; cancerous state; metastasis; identificat oestrogen receptor-positive breast cancer; therapy; oestrogen receptor-negative breast cancer; lung can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               differentially expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of premetastatic or metastatic cancerous states, stages of cancer, or responsiveness of cancer to therapy). This is particularly for breast cancer, oestrogen receptor-positive breast cancer, oestrogen receptor-negative breast cancer, oestrogen receptor-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAA00010 to AAA02716 represent polynucleotides isolated from cDNA libraries constructed from human colon cancer cell lines. The present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product that a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Williams LT, Escobedo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to Arthrobacter ureafaciens (IFO12140) acyl-CoA oxidase (I), which has excellent stability in the presence of thiol reagent at 37 degrees C. Also described are: the acyl-CoA oxidase gene (II) encoding (I); recombinant DNA (III) obtained by introducing (II) into a vector DNA; a transformed host or transduced host (IV) containing (III); and preparation of (I). (I) is useful in clinical diagnosis. The present sequence represents DNA encoding acyl-CoA oxidase. Note: The present sequence is not displayed in the specification but was obtained in electronic format directly from WIPO at

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABL01840-ABL16175) and the encoded proteins (ABL018777) ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                   capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL31515) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-BBD72072). The invention also describes the use of novel compositions for use in screening methods and provides compositions and methods associated with altered expression of TBX21 in cancer. Suitable cancers which can be diagnosed or screened by the invention includes acinar cell carcinoma, fibrosarcoma, Kaposi's sarcoma, breast cancer and hairy cell leukaemia. The present sequence is human carcinoma-associated (CA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       22-DEC-2000; 2000US-00747377.

                                                    CC promoter functional in a plant cell, where the promoter is positioned to comprise for expression of a polynucleotide encoding a polypeptide from a comprising the recombinant DNA construct and a method of producing a ctransformed plant having an improved property. The plant is a crop plant cell such as maize or soybean. The method of producing a plant with the crecombinant DNA construct and growing the transformed plant cell recombinant DNA construct and growing the transforming a plant with the crecombinant DNA construct is useful for improving plant, where the coll recombinant DNA construct is useful for producing plant properties. The recombinant DNA construct is useful for producing plant properties. The recombinant DNA construct is useful for producing plants with the cingroved plant properties, e.g. improved cold, heat or drought tolerance, content, improved plant with plant growth rate by modification of the cell cycle pathway with plant growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved yield by modification of carbohydrate, nitrogen or poston poston use and/or uptake, by modification of carbohydrate, nitrogen or production. This sequence represents a bacterial polynucleotide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at segdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polynucleotide; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a recombinant DNA construct comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2004-061375/06.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cao Y,

                                                                                                                                                                                                                                                                                                        The invention relates to a purified or recombinant nucleic acid (I) comprising a nucleotide sequence encoding a polypeptide involved in or required for the biosynthesis of ambruticin. The complement of the nucleotide sequence hybridizes to a nucleic acid encoding a domain selected from beta-ketoacylsynthase, acyltransferase, beta-ketoreductase, dehydratase, encylreductase, or acyl carrier protein domains of the sorangium cellulosum (synonym: Polyangium cellulosum) ambruticin gene cluster, or where the complement of the nucleotide sequence hybridizes to a nucleic acid encoding an amino acid sequence selected from (SEQ ID NO. 11-19 (AECT5784-AECT5782). The nucleic acid is useful for producing polyketides, including ambruticins and ambruticin analogs and derivatives. Ambruticins can be used for treating fungal infections. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acids encoding polyketide synthases and polyketide modification enzymes involved in or required for the biosynthesis ambruticin, useful for producing polyketides, e.g. ambruticins, fo treating fungal infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  08-MAR-2004; 2004US-0551103P.

                                                                                            comprising a nucleotide sequence encoding a polypeptide involved in or required for the biosynthesis of ambruticin. The complement of the nucleotide sequence hybridizes to a nucleic acid encoding a domain selected from beta-ketoacylsynthase, acyltransferase, beta-ketoreductase, dehydratase, encylreductase, or acyl carrier protein domains of the sorangium cellulosum (synonym: Polyangium cellulosum) ambruticin gene cluster, or where the complement of the nucleotide sequence hybridizes to a nucleic acid encoding an amino acid sequence selected from (SEQ ID NO. 11-19 (AEC75784-AEC75792). The nucleic acid is useful for producing polyketides, including ambruticins and ambruticin analogs and derivatives. Ambruticins can be used for treating fungal infections. The present sequence represents Polyangium cellulosum ambruticin biosynthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acids encoding polyketide synthases and polyketide modification enzymes involved in or required for the biosynthesis ambruticin, useful for producing polyketides, e.g. ambruticins, for treating fungal infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         08-MAR-2004; 2004US-0551103P
